

Practical information

Prices LCC-Lite softwaretool

LCC-Lite, stand-alone:	€	1.500,—
LCC-Lite, networkversion:	€	15.000,—

Workshop Basis LCC

The workshops Basis Life Cycle Costing with LCC-Lite are effective how to learn and to think correct and adequate with LCCT. The workshop exist of a two-days training with an accompanied practical assignment and a final meeting with a presentation of results.

By stimulating the use of Life Cycle Costing techniques, through giving workshops LCC-Lite has reduced the yearly investments with more than **40%** by high capital-intensive concerns.

Within public authorities the LCC-techniques can lead to less painful savings: the available tools are much better used.

Please contact us for practical engagements and additional information on this course and dates of the open workshops.

The costs of the training, including accompanied course and the use of the LCC software tool, are € 980,—*) per person.

Performed within your own organization the total course costs are € 9.800,—*) (10 participants maximum)

*) VAT excluded

LCC-Lite: Life Cycle Costing analyses on project level

Costs of capital investment and all related costs and cost effects over the entire life cycle, is what it is all about in Life Cycle Costing (LCC).

On project level, such a way of analysing future investments often bring savings. This is due to the fact that there has been made a complete assessment of all the expected costs.

Not only the initial investment will be looked at, but also the effects of interest and matters like period of use, maintenance and consumption of energy.

LCC illustrates clearly how different cost categories influence each other. Life Cycle Costing leads to well considered economic designing, choosing and planning

S&G and Partners B.V.

Costs come down...

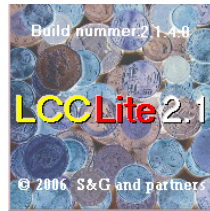

This LCC-method on project level lays the foundation for possibilities to work with life cycle costing on company- or even concern level.

Within budget orientated organizations life cycle costing means the end of a money wasting culture.

When the LCC thinking gets more common in the organization, budgets are more and more variable, more result-oriented and flexible applicated. Inevitably this will cause huge cost savings within such an organization.

The software tool LCC-Lite is specially made for cost-benefit analyses on project level, based on life cycle costing techniques

LCC-Lite makes profoundly comparing the costs over the life cycle a lot easier and faster.

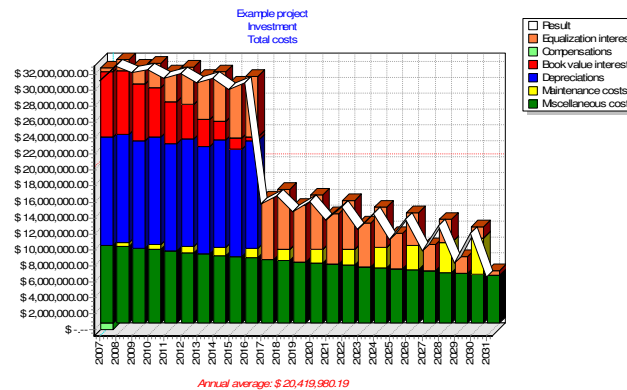

The economical aspects of different alternatives can be compared with each other faster.

It is also very easy to determine the economic replacement moment, with or without investment alternatives.

Graphics

A visual reproduction is evident in showing the results of the costs-benefits analyses. That is why in this software all analyses are presented in graphics.

Furthermore there are reports and overviews available.

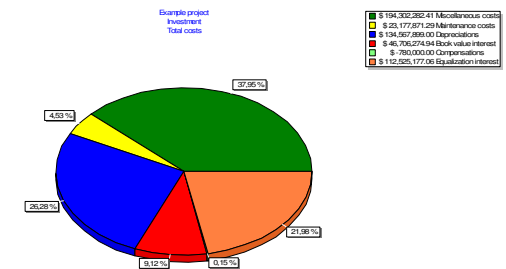

Pie chart

Besides some of the graphics can be presented in a "pie chart".

This way of visualising makes evident on which cost types the most savings are possible. Furthermore it shows the most reliable information of the cost types we need to give a good picture of the total project.

Sensitivity analyses can be easily worked out, based on for example different life cycles, interest percentages, calculation period, alternatives and different maintenance scenarios.
